

METHOD FOR REMOTELY CONTROLLING MEDICAL APPARATUSES AND DEVICE THEREFOR

ABSTRACT

5

A method for remotely controlling medical apparatuses and the method thereof are proposed. The medical apparatuses are used to take internal images of the human body, and have control command sets that comply with the DICOM specifications. In this method, a server is first built and connected
10 to the medical apparatuses. A remote device is then built and connected to the server. Next, the remote device executes a remote control program to generate at least a DICOM control command, which is then sent to the server. The server then executes a communication program to perform control communications with the medical apparatuses. The medical apparatuses can
15 thus be controlled to take images of the inside of human body for generating of digital image data complying with the DICOM specifications. The object of remote control for integrating medical apparatuses can thus be accomplished.
